

Powdercoating Maintenance Guide

Aluminium or Steel Products

Powdercoating Maintenance to ensure long-lasting attractiveness & protection against the elements.

This form of colour coating is one of the most durable available, providing style and substance year after year, it still nonetheless requires some degree of regular maintenance. With this level of care, you'll not only extend the life of your aluminium products but also ensure specific warranty requirements are met.

Any maintenance programme needs to consider the effects of ultraviolet light, general everyday pollution and the regular dirt and salt deposits that will accumulate on the product over time.

We recommend cleaning your aluminium products every three months. However, you may need to do so with more regularity depending on the general environmental conditions surrounding them. A location by the sea should be cleaned more often, for example, the salt air provides greater levels of deposits on the product. In industrial or geothermal areas, a cleaning programme may need to be carried out every month or two.

Maintenance steps

- 01.** Start by using a wet sponge to carefully remove any loose dirt
- 02.** Then use a mild, diluted detergent in warm water and a soft, non-abrasive brush to remove rest of dirt, any dust, salt and other surface deposits. Please Note: do not use solvents – instead use PH-neutral liquid hand dishwashing detergent.
- 03.** Thoroughly rinse all surfaces with clean water. Ensure all soap residue is fully removed.
